

9.1 Introduction to Geometry

Identifying lines, rays, and segments

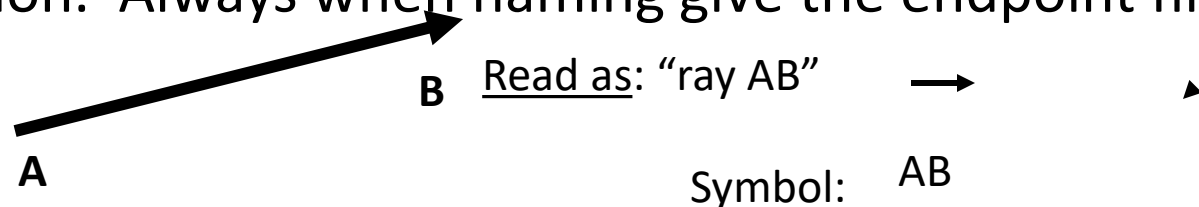

VOCABULARY

Point – usually labeled with an uppercase letter. Describes a specific location in space.

Line – points that extend without end in two opposite directions

Ray – has 1 endpoint and extends without end in *one* direction. Always when naming give the endpoint first.

Identifying lines, rays, and segments continued....

Segment – a piece of a line which has two endpoints Read as: “line segment BE or line segment EB”

Symbol: \overline{BE} or \overline{EB}

NOTE: You may have the points at the end of the segment or without.

Intersecting lines – two different lines that meet at a point

“Line TS intersects with line PQ”

Identifying lines, rays, and segments continued....

Parallel lines – two different lines that will never intersect no matter how far they extend.

“Line CD is parallel to line YZ.”

$\overleftrightarrow{CD} \parallel \overleftrightarrow{YZ}$

Let's Do Some Examples!

Identify and name the *line*, *ray*, or *segment*.

ray

\overrightarrow{MN} or \overrightarrow{NM}

line segment

\overline{QP} or \overline{PQ}

line

\overleftrightarrow{RS} or \overleftrightarrow{SR}

Now You Try!

Identify and name the *line*, *ray*, or *segment*.

ray

\overrightarrow{GF} or \overrightarrow{FG}

line

\overleftrightarrow{HJ} or \overleftrightarrow{JH}

segment

\overline{KL} or \overline{LK}

Now You Try Continued

1. Name 2 rays.

→ → → → → →
HL or GK or JG or JL or JK or JH

2. Name 2 segments that have G as an endpoint.

\overline{GH} and \overline{GJ}

3. Name a line.

↔
GH

4. Name 3 points.

Any 3 that includes L or J or K or H or G

Now You Try Continued

1. Name a pair of intersecting lines.

\longleftrightarrow \longleftrightarrow \longleftrightarrow \longleftrightarrow
 AB and EG or CF and EG

2. Name a pair of parallel lines.

\longleftrightarrow \longleftrightarrow
 AB and CF

3. Name DB and BA another way.

\longleftarrow \longrightarrow
 BD and AB
